MediScribe AI – 10 Minute Speech

MediScribe AI – 10 Minute Speech

Speaker 1:

Good morning respected judges and everyone present here.

We are Team MediScribe AI, presenting our solution under the theme Health and Biotechnology.

Our problem statement focuses on the inefficiency of medical data management for doctors.

Today, medical data remains fragmented. Doctors handle handwritten notes, scanned PDFs, lab reports, voice recordings, research papers, and appointment schedules — all scattered across different platforms. This fragmentation causes information loss, increases cognitive overload, and most importantly, wastes critical time.

There is currently no single, dedicated digital workspace designed specifically to meet all the needs of a medical professional — from research and documentation to patient management and scheduling.

And in healthcare, every second matters. Improving efficiency doesn't just save time — it can save lives.

To solve this, we introduce MediScribe AI — a RAG-integrated, AI-powered medical journal platform that centralizes all forms of medical data into one secure, structured ecosystem.

Our platform allows medical professionals to completely transition from manual systems to a fully digitalized, organized workspace.

Unlike conventional AI tools that generate answers using large language models and may hallucinate information, our system works differently.

We do not generate artificial answers.

Instead, our RAG system retrieves answers strictly from the documents uploaded by the medical professional. This ensures zero hallucination, grounded clinical retrieval, high reliability, and complete data ownership.

Doctors can even access their data offline, without requiring an internet connection.

MediScribe AI acts as a private digital workspace divided into two major sections:

Journal Section:

Upload – Doctors can upload any type of file, including PDFs, images, reports, and notes.

Image processing and PDF scanning integration.

Speech-to-text – Converts voice into transcripts.

Stylus mode – Write notes directly on screen.

Search Engine – Retrieves documented data instantly.

Super Search – Retrieves insights from the entire workspace.

Rephrasing tool – Restructures content for clarity.

Definition prompts – Clears small confusions during research.

Recent tab – Shows recently accessed files.

Calendar – Schedules appointments and reminders.

Search bar – Locates features instantly.

All uploaded data is structured and organized for quick retrieval — reducing retrieval time by nearly half.

Patient Section:

Patient History Records – Reports, status updates, next appointments.

Report Review System – Structured patient documentation.

Future plans include a medical news tab and secure data sharing features.

We use a Retrieval-Augmented Generation architecture without relying on external LLM hallucinations. We have already developed a Minimum Viable Product to demonstrate feasibility.

Speaker 2:

Our idea is highly feasible as we have already built a working MVP.

Potential challenges include marketing, learning curve, and increased screen time.

To overcome these, we will conduct online forums, provide tailored tutorials, and design the platform to reduce time on screens while improving workflow efficiency.

MediScribe AI aims to improve clinical decision-making, reduce medical errors, improve communication, support professional growth, reduce burnout, and restore focus on patient empathy.

Benefits include workflow optimization, organized data, easy patient record access, improved accuracy, faster diagnosis, secure storage, and 50% reduced retrieval time.

Social impact includes better patient care.

Economic impact includes efficiency gains for hospitals.

Environmental impact includes reduced paper usage.

Our monetization strategy:

Free basic version for medical students to build community.

Premium subscription features.

Hospital contracts for strong revenue stability.

Usage-based pricing model.

Resources required include development manpower, technical infrastructure, storage systems, and maintenance services.

In conclusion:

Medical professionals dedicate their lives to saving others. Yet, their data systems slow them down.

MediScribe AI is not just software. It is a productivity ecosystem designed specifically for doctors.

It centralizes.

It secures.

It structures.

It retrieves instantly.

And it restores time — the most valuable resource in healthcare.

With MediScribe AI, doctors spend less time searching and more time healing.

Thank you.
